Let's Start!

Wait, those are the wrong colors!

Learning Outcome:

Identify key information about people's jobs and places of work in spoken or written contexts.
Identify and recognize information related to concepts about graphic design related to IT.

Can Do Statements:

- I can talk about the evolution of color in computing.
- I can understand the importance of color in computing.
- I can explain the concepts of RGB, CMYK, and Palettes.

Ask your partner:

- Do you think that the colors you see on computer screens are similar to those in printing? Why? Why not?
- Why is it important for colors to be displayed correctly on screens and printed formats?

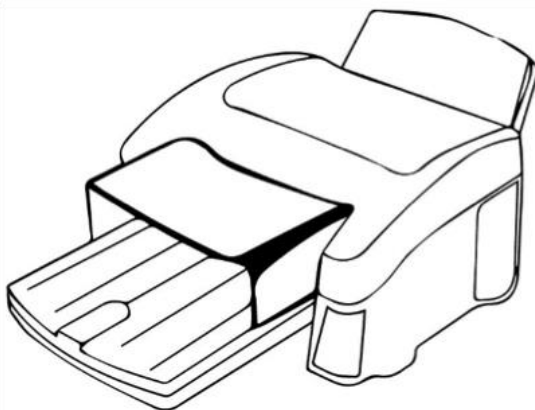

Let's Explore!

A woman complains* about mismatched colors.

*To "complain" means to express your dissatisfaction towards something.

Instructions: Read the text below.

Diane: This print looks so bad. The colors are all washed out!

Lucy: They do. However, on the screen, they look far better. But I think it's because of the color space of both the computer and your printer.

Diane: What's that?

Lucy: Computer screens have evolved greatly. They're not only the brightest, but also the most accurate currently. Designers and users need colors to be displayed correctly. However, at first, they were monochrome or black and white. And then, they started to display more colors, though not at the same time, that's why you see palettes, which have only 266 colors to save on processing load. The same has happened with printers, they've become more accurate. But older devices will show mismatched colors.

Diane: Well, I need colors to be as accurate as possible.

Lucy: In that case, I recommend you update your devices. Colors will not only be the brightest, but they'll also be the most precise.

Diane: Why do I need to update my devices?

Lucy: The thing is that color in computing depends on many factors, for example, for color displays, they appear in the RGB system. Which refers to the three different colors of light that a screen can produce, red, green, and blue. So they mix and form the colors you see in the display in different intensities.

Diane: But what does that have to do with printing quality?

Lucy: A lot! Because in printing, there's a different color system which is CMYK, it stands for cyan, magenta, yellow, and black. They also mix in different intensities to form the colors the system requires. In older systems, colors didn't really match. Newer devices include a very capable CMS or color matching system that ensures that colors will look alike both in displays and prints.

Let's Practice!

What a Great Color and Quality in These Images.

Instructions: Select the correct answer to complete the sentences.

1. Computer screens have evolved and they're _____, _____ currently.
 - a. not only the smallest, but also the most necessary
 - b. not only the brightest, but also the most accurate
 - c. not only the darkest, but also the most expensive
 - d. not only the newest, but also the most incredible
2. Colors will _____, _____.
 - a. not only be the brightest, but they'll also be the most precise
 - b. not only be the fastest, but they'll also be the most beautiful
 - c. not only be the oldest, but they'll also be the most expensive
 - d. not only be the cheapest, but they'll also be the most delicious
3. There are different printers in the market, _____ with black and white colors, _____ with a complete palette of colors.
 - a. not only the slowest, but also the most interesting
 - b. not only the creepiest, but also the most horrible
 - c. not only the oldest, but also the most precise
 - d. not only the sweetest, but also the most modern

Let's Practice!

Beautiful colors will enhance your work!

Instructions: Organize the mystery sentence. Read the sentences aloud. Check your pronunciation with your instructor.

1. show / of / printers / a / colors. / variety / great / will / Modern

2. be / colors / to / will / correctly / displayed / and / need / users / Designers

3. screen / that / different / will / of / can / colors / three / RGB / system / a / light / show / you / produce.

4. system; / a / will / for / stands / black. / use / magenta, / CMYK / it / yellow, / and / cyan, / You

Extension Activity

Designing a Brochure About Color in Computing.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about palettes of color in computing.
- Make notes about the evolution in color computing.
- Design a brochure with all this information.
- Use the grammar and vocabulary you studied in this lesson.
- Present your work to your class and explain.

Self-Assessment

Yes No

- I search about palette of colors used in graphic design and the different categories of colors in computing.
- I summarize the information I found.
- I create a brochure about color in computing.
- I use the grammar and vocabulary I learned.
- I talk about color in computing in front of my classmates and teacher.

☐	☐
☐	☐
☐	☐
☐	☐

Target Words

- accurate** (adjective): precise, exact or truthful
e.g. They've become more accurate.
But older devices will show mismatched colors.
- match** (verb): to be like something else or to be very similar
e.g. In older systems colors didn't really match.
- capable** (adjective): proficient, powerful or efficient
e.g. Newer devices include a very capable CMS or color matching system that ensures that colors will look alike both in displays and prints.

- washed out** (adjective): faded or with colors that lack intensity
e.g. This print looks so bad. The colors are all washed-out!
- designer** (noun): a person who produces designs, images or other creations
e.g. Designers and users need colors to be displayed correctly.
- palette** (noun): the range or group of colors that a system or designer can use at a given moment
e.g. That's why you see palettes, which have only 266 colors to save on processing load.

Learning Points

Superlatives (Not Only but Also).

You use **superlatives** to talk about a noun with a highly developed quality. **Not only but also**, is used to mention a parallel or even an additional idea.

In order to form superlatives with short adjectives, you need to use the definite article *the* + *adjective* + suffix "est" + complement.

Example:

*This is **the brightest** color in the palette.*

With long adjectives (two or more syllables), you need to use the definite article *the* + *most* + *adjective* + *complement*.

Example:

*We need to mix **the most appealing** colors together in the display.*

On the other hand, you can use superlatives with the expression **not only but also**. It is useful when you need to emphasize more than one characteristic of someone or something. It's used in two separate clauses. In the first clause, you use **not only**, and in the second one, you use **but also**. This last element is the one that provides an extra piece of information in the sentence. According to this, the structure will be as it follows:

Subject + verb + not only + superlative form (1)+ complement + , +	but also + superlative form (2) + complement
First clause	Second clause

Examples

- *Computers provide **not only** the fastest, **but also** the most efficient tools to edit photos.*
- *Good palettes show **not only** the biggest quantity of colors, **but also** the most realistic ones.*
- *They're not only the brightest, but also the most accurate currently.*
- *Colors will not only be the brightest, but they'll also be the most precise.*

Learning Points

Simple Future.

You can use the simple future to talk about a distant future, plans or things that you expect to happen.

In order to use the simple future, you need a subject, the auxiliary verb for the simple future "**will**", the main verb in base form and a complement.

Subject + **will** + **main verb in base form** + complement

Examples:

*We **will see** more realistic colors in computer screens.*

*Displayed and printed colors **will match** better in newer systems.*

Remember, after **will**, the verb goes without **to**, and it is not conjugated. In negative sentences, you can use "**will not**" or the contraction "**won't**".

Examples:

*Displays **won't get** larger in the future.*

*The display **will not get** larger in the future.*

Examples

- *But older devices will show mismatched colors.*
- *Newer devices include a very capable CMS or color matching system that ensures that colors will look alike both in displays and prints.*
